Blood tests

Equipment to help

Advice on driving

Eye test

Hearing test

Conversations with healthcare staff

Aphasia is an acquired communication disability caused by brain damage.

It causes difficulty with speaking and understanding speech. Many people also have difficulty with reading and writing.

Speak slowly but naturally. Use simple words. Make eye contact and speak directly to the person. Don't interrupt. One to one conversations are better. Ask questions that can be answered with yes or no. Use a pen and paper. Check that you have understood each other. Give written information using clear and simple language.

Remember that aphasia can mask someone's personality. Aphasia makes it difficult to express thoughts and ideas but intelligence remains the same.

This folder is adapted into English by G. Pearl and members at Speakeasy. The Norwegian original was made by G. Kitzmüller (UiT – the Arctic University of Norway), K. Berg (Nord University) & L. Haaland-Johansen (Statped), and was based on a communication guide designed at Adler Aphasia Center in Jerusalem by D. Olenik. The Norwegian project was funded by Dam Foundation via the Aphasia Association in Norway. Illustrations: H. Hegdal.
